

# A Practical Assignment:

Classifiers

 2 Contributors

# Goals

- 1 Construct classifiers of different types
- 2 Train them
- 3 Compare the performance

# Process

1

## First Step

Run a simple example with scikit learn and the iris dataset classification.

I suggest using a python notebook.

2

## The digits dataset

Scikit learn includes several datasets. One of them is the digits dataset. Get to know it.

3

## Define and train the classifiers

You should test the following types of classifier: KNN, SVM, MLP

Proceed one by one.

4

## Analyse the results

For each classifier use ...

5

## Compare the results

Compare results among classifiers, draw conclusions.

6

## Extra work

If time allows it, do the same for the MNIST dataset. (notice that KNN will be too slow, explain why).

Include convolutional classifiers.

# Project Delivery and Presentation

1. Via infoforestudante, Deadline September 29, 2026
2. The code
3. A short report explain the functionalities and highlighting the main points (4 pages or less).
4. The presentations of will be scheduled for September 30
